| Population         | Sample         |
|--------------------|----------------|
| Variable           | Sampling Error |
| Non-Sampling Error | Bias           |
| Validity           | Reliability    |

| A subset of the population that is studied to represent the entire population.  | The entire group that the survey aims to study and make inferences about.  |
|---|--|
| The difference between the sample statistic and<br>the true population parameter, caused by<br>studying only a sample rather than the entire<br>population.   | A characteristic or measurement that can take<br>on different values for the individuals in the<br>study.                                |
| Any influence that produces a systematic error<br>or distortion in the survey results, leading to<br>inaccurate representations of the population.            | Errors in the survey process that are not due to<br>sampling, such as response bias, question<br>wording issues, or data entry mistakes. |
| The consistency and stability of the survey<br>results, indicating that the survey would produce<br>similar results if repeated under the same<br>conditions. | The extent to which the survey measures what it<br>is intended to measure and permits accurate<br>inferences about the population.       |
